## pH scale

power of Hydrogen
pH
pH

## Scale used to measure the concentration of hydrogen ions, $\mathrm{H}^{+}$, in a solution.

Scale used to measure the concentration of hydrogen ions, $\mathrm{H}^{+}$, in a solution.

Scale generally runs from 0-14
pH
$\begin{array}{lllllllllllllll}0 & 1 & 2 & 3 & 4 & 5 & 6 & 7 & 8 & 9 & 10 & 11 & 12 & 13 & 14\end{array}$

Scale generally runs from 0-14

## $\begin{array}{llllllllllllll}0 & 1 & 2 & 3 & 4 & 5 & 7 & 8 & 9 & 10 & 11 & 12 & 13 & 14\end{array}$

In pure water a few of the water, $\mathrm{H}_{2} \mathrm{O}$, molecules will split up into hydrogen, $\mathrm{H}^{+}$, and hydroxide, $\mathrm{OH}^{-}$, ions.
$\mathrm{H}_{2} \mathrm{O} \rightarrow \mathrm{H}^{+}+\mathrm{OH}^{-}$

## $\begin{array}{lllllllllllllll}0 & 1 & 2 & 3 & 4 & 5 & 6 & 7 & 8 & 9 & 10 & 11 & 12 & 13 & 14\end{array}$

In pure water the number of $\mathrm{H}^{+}$and $\mathrm{OH}^{-}$ions are equal. $\mathrm{H}^{+}$and $\mathrm{OH}^{-}$are balanced.

This corresponds to a pH of 7 .
pH $7=$ Neutral
$\mathrm{H}^{+}$
$\mathrm{OH}^{-}$
$\mathrm{OH}^{-}$

## $\begin{array}{llllllllllllll}0 & 1 & 2 & 3 & 4 & 5 & 6 & 7 & 8 & 9 & 10 & 11 & 12 & 13\end{array} 14$

If an acid is added to the water, the quantity of $\mathrm{H}^{+}$will increase.

Acids release $\mathrm{H}^{+}$

more $\mathrm{H}^{+}$<br>pH value drops

## Acids

pH

## $\begin{array}{lllllllllllllll}0 & 1 & 2 & 3 & 4 & 5 & 6 & 7 & 8 & 9 & 10 & 11 & 12 & 13 & 14\end{array}$

If an acid is added to the water, the quantity of $\mathrm{H}^{+}$will increase.

Acids release $\mathrm{H}^{+}$

## $\begin{array}{llllllllllllll}0 & 1 & 2 & 3 & 4 & 5 & 6 & 7 & 8 & 9 & 10 & 11 & 12 & 13 \\ 14\end{array}$

* The stronger the acid, the lower the pH.
- An acid with $\mathrm{pH}=5$ is 10 X stronger than $\mathrm{pH}=6$
- An acid with $\mathrm{pH}=3$ is 10 X stronger than $\mathrm{pH}=4$
- An acid with $\mathrm{pH}=2$ is 100 X stronger than $\mathrm{pH}=4$

## $\begin{array}{llllllllllllll}0 & 1 & 2 & 3 & 4 & 5 & 6 & 7 & 8 & 9 & 10 & 11 & 12 & 13\end{array} 14$

If a base is added to the water, the quantity of $\mathrm{OH}^{-}$will increase.

## Bases release $\mathrm{OH}^{-}$

less $\mathrm{H}^{+}$<br>pH value rises

## $\begin{array}{lllllllllllllll}0 & 1 & 2 & 3 & 4 & 5 & 6 & 7 & 8 & 9 & 10 & 11 & 12 & 13 & 14\end{array}$

If a base is added to the water, the quantity of $\mathrm{OH}^{-}$will increase.

## Bases release $\mathrm{OH}^{-}$

* The stronger the base, the higher the pH .

## $\begin{array}{lllllllllllllll}0 & 1 & 2 & 3 & 4 & 5 & 6 & 7 & 8 & 9 & 10 & 11 & 12 & 13 & 14\end{array}$

Dissolving a salt in the water (normally) does not affect the balance between $\mathbf{H}^{+}$and $\mathbf{O H}^{-}$ions.

Saline (salt) solutions are usually neutral: $\mathrm{pH}=7$

Mathematics behind the pH scale
Exponents and Logarithms

$$
\begin{array}{rlrl}
10^{3} & =1000 & 10^{?} & =1000000 \\
10^{-3} & =0.001 & ? & =\log (1000000) \\
10^{-5} & =0.00001 & ? & =6 \\
10^{2.5} & \approx 316.2278 & &
\end{array}
$$

Mathematics behind the pH scale
Exponents and Logarithms

$$
\begin{aligned}

10^{-5} & =0.00001 \\
10^{2.5} & \approx 316.2278
\end{aligned}
$$

$$
\begin{aligned}
10^{?} & =5000 \\
? & =\log (5000) \\
? & \approx 3.699
\end{aligned}
$$

Mathematics behind the pH scale

Concentration of hydrogen ions measured in moles per litre ( $\mathrm{mol} / \mathrm{L}$ )
(a.k.a. molar concentration)

Pure water (Neutral):

$$
10 \times \text { more } \mathrm{H}^{+}: \quad\left[\mathrm{H}^{+}\right]=1 \times 10^{-6} \mathrm{~mol} / \mathrm{L}
$$

A really small amount of $\mathrm{H}^{+}$:

$$
\left[\mathrm{H}^{+}\right]=1 \times 10^{-7} \mathrm{~mol} / \mathrm{L}
$$

$$
(0.0000001 \mathrm{~mol} / \mathrm{L})
$$

$$
(0.000001 \mathrm{~mol} / \mathrm{L})
$$

$$
\left[H^{+}\right]=1 \times 10^{-13} \mathrm{~mol} / \mathrm{L}
$$

$$
(0.0000000000001 \mathrm{~mol} / \mathrm{L})
$$

$$
\mathrm{pH}=-\log \left[H^{+}\right]
$$

$\mathrm{pH}=7$
$\mathrm{pH}=6$
$\mathrm{pH}=13$
